Received 31 May 2011; accepted 7 June 2011

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(C-C) = 0.003$ Å; R factor = 0.037; wR factor = 0.082; data-to-parameter ratio = 18.2.

In the title compound, $[Mn(NCS)_2(C_{13}H_{19}N_3O)(H_2O)]$, the Schiff base acts as an N,N',N'' -tridentate ligand, forming two five-membered chelating rings with the Mn^{II} atom. The distorted octahedral geometry around the metal atom is completed by two *cis*-positioned N -bound thiocyanate ligands and one water molecule. In the crystal, adjacent molecules are linked through $O-H\cdots O$, $O-H\cdots S$ and $C-H\cdots S$ hydrogen bonds into a three-dimensional supra-molecular structure. An intramolecular $C-H\cdots O$ hydrogen bond also occurs.

Comment

The crystal of the title compound is isostructural with the previously reported Co^{II} complex (Suleiman Gwaram *et al.*, 2011). The metal center is coordinated by the *N,N',N''*-tridentate Schiff base, two *N*-donor thiocyanates and one water O atom in a distorted octahedral geometry. In the crystal, the molecules are linked through O—H···O and O—H···S hydrogen bonds into layers parallel to the *ac* plane and these are connected into a three-dimensional network *via* C—H···S interactions. Moreover, intramolecular C—H···O hydrogen bonding is observed.

Experimental

A mixture of 2-acetylpyridine (0.20 g, 1.65 mmol) and 4-(2-aminoethyl)morpholine (0.21 g, 1.65 mmol) in ethanol (20 ml) was refluxed for 2 hr followed by addition of a solution of manganese(II) acetate tetrahydrate (0.41 g, 1.65 mmol) and ammonium thiocyanate (0.13 g, 1.65 mmol) in a minimum amount of ethanol. The resulting solution was refluxed for 30 min, and then left at room temperature. The crystals of the title complex were obtained in a week.

Refinement

The C-bound H atoms were placed at calculated positions and were treated as riding on their parent C atoms with C—H = 0.95 (aryl), 0.98 (methyl) and 0.99 (methylene) Å. The O-bound H atoms were located in a difference Fourier map, and refined with a distance restraint of O—H 0.84±0.02. For all H atoms, $U_{iso}(H)$ was set to 1.2(1.5 for methyl) U_{eq} (carrier atom). An additional rigid-bond type restraint (DELU in *SHELXL97*) was placed on the displacement parameters of S2 and C15.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
