 Key indicators: single-crystal X-ray study; $T = 139$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.049; wR factor = 0.161; data-to-parameter ratio = 15.3.

The title Schiff base, $\text{C}_{17}\text{H}_{15}\text{N}_3\text{O}_3$, exists in the zwitterionic form with the phenol H atom transferred to the imine group. Adjacent zwitterions are linked into a linear chain running along the a axis by an indole-hydroxy $\text{N}-\text{H}\cdots\text{O}$ hydrogen bond [3.100 (2) Å].

2-[2-(1*H*-indol-3-yl)ethylanimomethyl]-4-nitrophenolate

H. M. Ali, M. I. Mohamed Mustafa, M. R. Rizal and S. W. Ng

Experimental

Tryptamine (0.32 g, 2 mmol) and 5-nitrosalisylaldehyde (0.33 g, 21.9 mmol) were refluxed in ethanol (50 ml) for 2 h. The solvent was removed to give the product Schiff base, and crystals were obtained by recrystallization from THF.

Refinement

The carbon-bound H atoms were placed at calculated positions (C–H 0.95 Å), and were included in the refinement in the riding model approximation with $U(\text{H})$ set to $1.2U_{\text{eq}}(\text{C})$. The amino hydrogen atom was located in a difference Fourier map, and was refined with a distance restraint of N–H 0.88 ± 0.01 Å.

The final difference Fourier map had a large peak at 1.5 Å from O1 and H2*n*. This peak is not near the the nitro group even though this group has larger thermal parameters than the rest of the molecule.

Figures

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
